NEXA RETAIL

Product Return and Exchange Procedure

Handling online return and exchange requests across customer service, warehouse and payment operations

Version 1.1 | Published: June 18, 2024

Purpose

This procedure defines the standard return and exchange flow for online consumer orders, including request creation, shipment, warehouse acceptance, product checks and the initiation of refunds. It is intended to keep customer communication and operational handling consistent across teams.

1. Scope

This procedure applies to standard retail orders placed through the Nexa Retail website and mobile application and delivered to an end customer. Store purchases, contract-based business orders, repair-only technical service cases and digital-only products are handled under their applicable processes.

Return request creation, return shipment and warehouse acceptance are within scope. The time at which a refund appears in a customer account can also depend on the payment provider or bank and is therefore tracked separately after operational approval.

2. Operating Principles

- A request is processed after the order, product and customer-reported reason have been identified.
- The standard return period is 14 calendar days from the delivery date.
- Unless otherwise stated, the product should be sent with the accessories and product components supplied with the order.
- Product condition and the stated return reason are checked during warehouse acceptance; additional review can be opened when required.
- Creating a return request does not by itself mean that a refund has been completed.

Operations note When a case falls outside the standard flow, support agents should record the facts and start the appropriate review rather than promising a final outcome before the review is completed.

3. Evaluating Return Eligibility

The standard return period is calculated from the recorded delivery date. If the customer statement and carrier delivery record differ, the delivery record should be checked before a definitive decision is communicated. Where no reliable delivery confirmation is available, the record should be corrected or investigated first.

3.1 Standard period

A customer may create a return request for a standard eligible product within 14 calendar days from delivery. It is sufficient for the request to be created within the period; the parcel does not have to be handed to the carrier on the same day. The validity of the generated return-shipping code must still be considered separately.

3.2 Date used for calculation

- Use the delivery date, not the order creation date.
- If products in the same order are delivered on different days, evaluate each product against its own delivery date.
- If the carrier record has been corrected, use the updated delivery event.
- Orders that could not be delivered and were returned to sender are handled as undelivered shipments rather than standard customer returns.

3.3 Products that may require separate evaluation

The following product groups and situations are not automatically accepted through the standard return flow. A case can still be opened, but the outcome depends on product conditions and the review result:

- Personalized, made-to-order or customer-specific products.
- Products whose protective packaging has been opened where hygiene rules affect resale eligibility.
- Activated digital products or products with a redeemed license code.
- Impact, liquid exposure, breakage or other physical damage that appears to have occurred during use.
- Products without a readable serial number, product label or other required identifier.

Important Being within the return period does not automatically satisfy every acceptance condition. Time eligibility and product condition are evaluated together.

4. Creating a Return Request

The standard return request is created from the customer account through Account > Orders > Order Details > Create Return Request. The customer selects the relevant item and return reason. When an order contains several items, the request applies only to the items selected.

The system creates a return reference for the case. Support agents can see the return reference, order number and selected reason. The order number and return reference serve different purposes; carrier handoff should use the return-shipping information generated for the request.

5. Return Shipping

After the return request enters the approved shipping flow, a return-shipping code is generated for supported shipments. The code may be shown in the customer account and sent through the registered contact channel. The customer uses it when handing the parcel to the designated carrier.

5.1 Return-shipping code

The return-shipping code can be used for 7 days from the date it is created. If it expires, the current return status should be checked before another code is issued. More than one active return shipment should not be created for the same product at the same time.

- The shipping code is valid only for the related return request and selected products.
- If the customer ships independently, the carrier tracking number should be added to the support case.
- A carrier delay does not mean the warehouse has accepted the return or that the refund is complete.

5.2 Packaging

The customer is responsible for packaging the product so that it is protected during transport. Where available, the original product box, accessories, manuals and supplied components should be included. The absence of the outer delivery carton alone is not an automatic rejection reason; product packaging and product condition are evaluated separately.

5.3 Shipping cost

When the system-generated contracted-carrier code is used for a standard return, no separate return-shipping fee is charged to the customer. A different carrier or shipping method selected by the customer is not automatically reimbursed. Defective or incorrectly supplied products may be routed through a different shipping arrangement.

6. Warehouse Acceptance and Product Check

When a return reaches the warehouse, the parcel is received, matched to the return reference and sent to product inspection. A carrier status of Delivered does not mean that warehouse acceptance or product inspection has been completed.

6.1 Checks performed

- Match the product to the return request.
- Verify serial number or other tracked identifiers where applicable.
- Check the condition of required accessories and supplied components.
- Look for signs of use, impact, breakage, liquid exposure or similar physical damage.
- Compare the recorded return reason with the condition received.

6.2 Missing or different product

If the parcel contents do not match the return request, the case is placed on hold while warehouse records, available package images and product identifiers are reviewed. A final rejection should not be communicated before the mismatch is confirmed.

7. Defective, Faulty or Damaged Products

A customer report that a product is faulty, defective or damaged may begin through the standard return channel, but product-specific technical or operational review may be required. In particular for electronics, the customer statement alone does not determine whether the final outcome will be replacement or refund.

7.1 Damage reported at delivery

Where the outer package shows visible crushing, opening, moisture or other damage, the customer should provide delivery-condition images where reasonably available. Carrier damage records should be attached to the case. If the product itself is also damaged, the case can be handled together with the wrong/damaged item flow.

7.2 Product does not operate as expected

Reported symptoms should be recorded clearly. Basic remote checks may be performed depending on product type. If the issue cannot be resolved through those checks, the product is accepted for review.

7.3 Review outcome

If review confirms a product defect, incorrect shipment or delivery damage, the case may result in a refund, replacement or another appropriate remedy. If user-caused physical damage is identified, a standard return approval is not given; technical service or paid repair options may be communicated where available.

Customer communication Do not promise a definite replacement or refund before a required product review has been completed.

8. Exchange Requests

Where stock and product category allow it, the customer may request an exchange. Exchange is not available for every product or campaign. For a color, size or variant change, stock is checked at the time the case is processed. If exchange cannot be fulfilled, the customer may be directed to the return flow.

9. Initiating the Refund

After warehouse acceptance and any required product checks are complete, an eligible return is sent to the payment process. A return record moving to Approved and the money appearing in the customer account are separate events.

Refunds generally appear in the customer account within 3-10 business days after the operational refund instruction is issued. The actual timing can vary by payment method and bank. Where a bank or payment provider delay is suspected, the available payment reference should be used for follow-up.

10. Payment Method Considerations

10.1 Credit and debit cards

Card refunds are sent back to the original payment instrument where possible. Depending on the bank, installment transactions may appear as one or more account entries. Support agents should not promise the exact date on which the bank will show the refund.

10.2 Bank transfer

For orders paid by bank transfer, account information may need to be confirmed before a refund can be completed. If the account holder and order owner differ, Finance may request an additional check. Incomplete or incorrect bank information can delay the payment.

10.3 Campaign and discounted orders

For partial returns from discounted baskets, the refundable amount is based on how the discount was allocated in the original order. The customer should not be treated as if each item had been purchased at the list price. Multi-item campaigns can affect the amount returned when only part of the order is sent back.

11. Promotional and Gift Items

If a free or discounted item was supplied because another product was purchased, the campaign rules are considered during the return. The gift item may need to be returned when the return breaks the original campaign conditions.

12. Partial Returns

A customer can return only some items from an order. Shipping and promotion effects are reviewed at order level. When one item carries a discount generated by another item, the final refund amount may differ from the visible unit list price.

13. Requests Outside the Standard Flow

Passing the standard time limit, failing an automatic eligibility check or being outside a standard product category does not prevent the customer from opening a support case. The facts are recorded and sent for review. An exception review is not presented as a standard entitlement and each case is considered against its records.

- Orders with missing or inconsistent delivery records.
- Return parcels with extended carrier inactivity.
- Campaign outcomes that do not match the recorded offer conditions.
- Refunds where the order owner and payment owner differ.
- Parcels that cannot be matched to the expected warehouse return.

14. Customer Service Checklist

The following information should be verified on the same case wherever practical. Missing information does not automatically mean the return will be rejected, but inconsistent case records should be avoided.

1. Confirm the order number and product being returned.
2. Check the delivery date and the date the customer created the request.
3. Record the return reason in clear language without changing the customer's meaning.
4. If the product is faulty or damaged, record symptoms and any available carrier or image evidence.
5. If a return-shipping code was generated, explain how it is used.
6. Do not promise a final refund or exchange before warehouse or technical review is complete.
7. If a refund has been initiated, verify the original payment method and available payment reference.

15. Interpreting Common Case Statuses

Request created

The return request exists; the product may not yet have been shipped.

Handed to carrier

The return parcel has entered carrier transport; warehouse acceptance is not complete.

Delivered to warehouse

The parcel has reached the warehouse; product inspection may still be pending.

Return approved

The operational return decision is complete; payment settlement is tracked separately.

Refund initiated

The refund instruction has been sent to the payment channel; bank posting can occur later.

16. Record Keeping

Customer conversations, return reason, shipping details, supporting images and review outcomes should remain traceable within the same case chain. Where several support cases exist for the same issue, agents should link or reference them to avoid fragmented handling.

17. Common Situations

Request created on day 14, parcel shipped later

The request date determines whether the request was opened within the standard return period. The return-shipping code validity is checked separately. If the code has expired and the request is still eligible for shipment, a new shipping instruction may be created.

Carrier says Delivered, but the return is not complete

Carrier delivery and warehouse acceptance are different steps. The parcel may be waiting for receipt or product inspection. The refund should not be described as complete based only on the carrier event.

Product box has been opened

Opening the box is not an automatic rejection for every product. Product type, hygiene requirements, use condition and resale eligibility are considered together.

Customer cannot see the refund at the bank

First confirm that the return was operationally approved and a refund instruction was created. If so, provide the instruction date and payment reference where available. Bank posting time can differ from Nexa Retail processing time.

18. Related Processes

- Shipping and Delivery Operations - carrier movement, delivery failures and return shipments.
- Warranty and Technical Support - technical review, warranty handling and service routing.
- Payments, Refunds and Invoicing - payment channels, financial refund settlement and invoice handling.
- Account Access and Security - account access and authentication issues.

19. Application Notes

Support teams should not communicate unverified system or carrier information as a final outcome. Where system status, carrier status and warehouse/payment records differ, the relevant operational record should be reviewed before the case is described as completed.

The standard timing and steps described here do not override a clearly applicable campaign or product-specific condition. The result communicated to the customer should match the actual order, product and operational records.
