NEXA RETAIL

Return Process and Customer Requests

Current handling framework for online return requests, return shipping and post-return customer communication

Version 2.0 | Published: February 1, 2026

Purpose

This guide defines the return process used for standard online consumer orders and the information that customer-facing and operations teams should rely on when handling a return. It covers request timing, return shipment, warehouse review, special cases and handoff to the payment process.

1. Where This Process Applies

The process applies to eligible consumer orders completed through Nexa Retail digital sales channels. It is designed for standard returns after delivery and is used together with product-specific, campaign, technical support and payment rules when those conditions apply.

A return request can include one or more items from the same order. Each item is evaluated against its own delivery record and product condition, even when the customer submits the items together.

2. Standard Return Window

For standard eligible products, the customer may create a return request within 30 calendar days from delivery. The recorded delivery date is used as the starting point. The request must be created within the applicable period; the physical parcel may be handed to the carrier afterward as long as the shipment instruction remains valid.

- Use the delivery event for the item, not the order date.
- For split deliveries, evaluate each item against the date on which that item was delivered.
- If the carrier delivery record is being investigated, avoid a final eligibility statement until the delivery date is confirmed.
- A failed delivery that is automatically returned to sender is handled under the undelivered-shipment flow.

Customer wording When explaining the return period, use the delivery date as the reference and avoid describing the order date as the start of the return window.

3. Starting a Return

The normal customer path is Account > Orders > Order Details > Create Return Request. The customer selects the item, quantity where applicable and a reason. The request is associated with the original order and generates a return reference used for operational tracking.

The return reference is not a substitute for the shipment instruction. Where the system produces a carrier return code or label, that shipping information should be used for the physical handoff.

3.1 Information captured with the request

- Order and item being returned.
- Customer-selected return reason.
- Quantity, where more than one unit was purchased.
- Optional customer note or product symptom.
- Available supporting images for visible damage or incorrect delivery.

3.2 Request cannot be created online

If the account interface does not allow the customer to create a request, support should verify delivery date, product category, existing returns and campaign conditions. A support case may be opened for review when the reason for the block is not clear. The customer should not be asked to create multiple duplicate requests for the same item.

4. Products Requiring Additional Review

Some products cannot be decided solely from the time window. Personalized items, opened hygiene-sensitive products, activated digital products and products showing physical damage may require a product-specific review. A return request can still exist while the final outcome remains pending.

For reported defects, technical review can be required even when the product is within the standard return window. A defect report should include the observed behavior, conditions under which it occurs and any troubleshooting already performed.

5. Return Shipping

For supported returns, the system provides return-shipping instructions after the request is accepted into the shipping flow. The customer should use the carrier and return code shown for that request. A code is associated with the selected return items and should not be reused for unrelated products.

5.1 Shipment validity

A generated return-shipping code is normally available for 10 days. If the code is no longer accepted, support should first check whether the return request is still active and whether a shipment has already been created before issuing another instruction.

5.2 Customer-arranged shipment

When a customer uses a different carrier without a system-generated return instruction, the shipment tracking number should be recorded. Shipping costs are not automatically reimbursed unless the case qualifies for an exception such as an incorrect or defective shipment and the customer was directed to use that method.

5.3 Parcel preparation

Products should be packed to prevent damage during transportation. Where practical, accessories, bundled components and documentation supplied with the product should be returned together. Missing outer transport packaging alone does not determine the outcome.

6. Warehouse Receipt

The warehouse receipt event occurs after the carrier delivery event. A parcel may be physically at the warehouse while still waiting for system receipt or product matching. Customer communication should distinguish Carrier Delivered from Warehouse Received and Return Approved.

7. Product Review and Decision

During receipt, the warehouse checks that the product matches the request and verifies tracked identifiers where used. Product condition, accessories and the recorded return reason are reviewed. Cases with inconsistencies can be placed on hold while supporting records are examined.

7.1 Standard approval

A standard approval can be completed when the return is within the applicable period, the received item matches the request and no product-specific exclusion or unresolved issue applies.

7.2 Incorrect, incomplete or damaged return

If the wrong product is received, required product components are missing or new physical damage is observed, the case should be documented before a final outcome is communicated. The customer may be asked for additional information when the package record alone is not sufficient.

7.3 Defect-related cases

A defect-related return can move to technical inspection where needed. The final remedy may be refund, replacement, repair or another applicable resolution depending on the product and review result. Support agents should describe the review step rather than guarantee a particular remedy.

8. Exchange and Replacement

Exchange or replacement is available only when the relevant product flow supports it and suitable stock exists. A customer preference for another color, size or variant does not guarantee exchange. Where exchange cannot be completed, the return can continue and a separate order may be required.

9. Refund Handoff

Once an eligible return has been approved, the case is handed to the payment process. The return approval date, refund instruction date and date the customer sees funds in an account are not the same event.

Customer-facing teams should not promise a fixed bank posting period from this return process. The refund channel, transaction type, bank and payment-provider processing can affect when the customer sees the result. Payment-specific guidance should be taken from the Payments, Refunds and Invoicing process.

9.1 Partial return and promotions

For a partial return, the refund amount is calculated from the original transaction after applicable promotions, discounts and gift-item conditions are considered. Removing one item from a campaign can change how the remaining discount is allocated.

9.2 Refund status language

- Return approved - the operational return decision is complete.
- Refund instruction created - the payment process has received the refund request.
- Refund sent - the payment instruction has been transmitted to the applicable payment channel.
- Customer account posting - controlled by the receiving bank or payment provider after the refund is sent.

10. Campaign-Specific Returns

Campaign terms may define how bundled products, gift items or conditional discounts are treated when one item is returned. The campaign record applicable to the original order should be checked. General return timing does not by itself determine the final refund amount in a campaign case.

11. Exceptions and Manual Review

A support case can be created when the normal self-service flow does not reflect the actual order situation. Manual review is appropriate when the delivery record is disputed, the carrier loses a return parcel, a campaign rule appears inconsistent with the order, or a warehouse receipt cannot be matched.

- Do not create repeated return requests to force the system past an eligibility check.
- Record the reason for manual review and the evidence available.
- Keep carrier, warehouse, technical and payment references linked to the same case when possible.
- An exception decision should be communicated as case-specific and not as a general policy.

12. Customer Service Checklist

1. Confirm the product and delivery date.
2. Check whether a return already exists.
3. Verify the customer's requested outcome and reason.
4. Provide the current return-shipping instruction if available.
5. Explain any pending warehouse or technical review.
6. Do not describe a carrier delivery event as a completed refund.
7. For payment timing, use the payment process and actual refund record rather than a fixed promise.

13. Frequently Seen Cases

Request created close to the end of the return window

Eligibility is based on the request creation date and recorded delivery date. Shipping can occur later if the return remains active and the shipping instruction is valid.

Customer says the app path looks different

The mobile application can present return actions under the order detail screen rather than the exact wording used on the web interface. Support should help the customer identify the order and available return action without assuming that identical menu labels appear on every client.

Carrier says the parcel arrived but warehouse status has not changed

Allow for the separate warehouse receipt and matching step. If the status does not update within the expected operational window, open a trace using the carrier tracking number and return reference.

Customer asks for the exact day money will be visible

Confirm whether the refund instruction has been created and provide the available reference. Do not commit to an exact bank posting day unless the payment record itself provides a confirmed settlement date.

14. Related Guidance

- Shipping and Delivery Operations Guide - carrier and parcel handling.
- Warranty and Technical Support Guide - technical inspection and product defects.
- Payments, Refunds and Invoicing Guide - payment settlement and financial status.
- Customer Help FAQ - common customer-facing questions and self-service wording.

15. Record Quality

The return record should make it possible for another agent or operations user to understand what the customer requested, what evidence was checked and what step is pending. Avoid duplicating incomplete notes across several cases when one linked case can preserve the full history.
