NEXA RETAIL

Warranty and Technical Support Guide

Product troubleshooting, inspection, warranty handling and service outcomes

Version 2.1 | Published: May 7, 2026

Purpose

This guide defines the technical-support path used when a customer reports that a product is not operating as expected. It covers initial troubleshooting, inspection, warranty considerations, service outcomes and the relationship between technical support and standard returns.

1. Technical Support Scope

Technical support applies to products that require diagnosis, inspection or service before the correct remedy can be determined. It can be used for products inside or outside the standard return period depending on the issue and product terms.

A technical case should distinguish a functional problem from delivery damage, missing components, incorrect product shipment and customer setup questions. These conditions can require different teams even when the customer describes all of them as “the product is broken.”

2. Initial Troubleshooting

Before requesting a product return for inspection, basic checks may be completed when they are safe and appropriate for the product. The goal is to confirm the symptom and rule out common configuration issues, not to delay a valid hardware case.

- Confirm product model and power/connectivity conditions.
- Record any error code or visible indicator.
- Check whether the issue occurs consistently or only under specific conditions.
- Confirm any software or firmware version relevant to the symptom.
- Do not instruct the customer to open sealed hardware or perform an unsafe repair.

3. Warranty Coverage

Many Nexa Retail products are sold with a 24-month warranty, but the exact period and coverage depend on the product, supplier and sales terms. Product-specific documentation or the order record should be checked before a fixed warranty period is communicated as a guarantee.

3.1 Warranty start

Warranty timing normally follows the documented sales or delivery basis for the product. Where the supplier warranty uses a different starting event, the applicable product terms are used. Replacement products may have separate coverage rules depending on the supplier.

3.2 Conditions commonly outside standard warranty

- Impact, breakage or crushing after delivery.
- Liquid exposure where the product is not designed for that condition.
- Unauthorized modification or repair.
- Use outside documented environmental or electrical limits.
- Consumable wear or expected degradation that is not a manufacturing defect.

Inspection principle A reported symptom does not by itself prove or disprove warranty coverage. Where physical inspection is required, the final coverage decision follows the inspection record.

4. Product Inspection

Products sent for technical review are matched to the service case and inspected for the reported symptom, visible condition and tracked identifiers. The inspection can reproduce the fault, identify a setup issue, identify external damage or conclude that the reported symptom could not be reproduced.

5. Possible Service Outcomes

5.1 Repair

Repair can be offered when the product is serviceable and the repair is covered or accepted as a paid service. The customer should be informed if data can be lost during repair or if the device may be reset to factory settings.

5.2 Replacement

Replacement can be approved when the product terms and inspection result support it and replacement stock is available. A newly reported defect does not automatically create an immediate replacement before the required checks are completed.

5.3 Refund

A refund can be selected when the case qualifies under return or warranty handling and refund is the appropriate remedy. Technical support does not determine the bank posting time; once the refund is approved, the payment process applies.

5.4 No fault found

If the reported symptom cannot be reproduced, the inspection record should state the conditions tested. The product may be returned to the customer, or additional evidence may be requested if the issue is intermittent and the customer can provide logs, video or a clear reproduction sequence.

6. Paid Service

When a problem falls outside warranty but the product is serviceable, a paid repair may be offered. Cost approval should be obtained before chargeable work begins. Diagnostic and shipping fees depend on the service arrangement and should be communicated from the actual service quotation.

7. Software and Firmware Issues

Some products depend on firmware, mobile applications or cloud services. A reported hardware symptom may be caused by an unsupported software version, incomplete update or service outage. Record software context when it materially affects the problem.

7.1 Updates

Where an official update is recommended, provide the customer with the supported update path. Do not instruct customers to install unofficial firmware or recovery images. If an update fails and the product becomes unusable, record the point of failure and any error message before additional recovery steps.

7.2 Data and privacy

Technical service can require resetting a device or replacing storage components. Customers should be advised to back up personal data when possible. Support should not request passwords or unrelated personal content as part of troubleshooting.

8. Service Timing

Technical review time depends on product category, fault complexity, part availability and whether supplier involvement is required. A fixed 10-business-day completion promise should not be used for every technical case. Use the actual service estimate or status available for the case.

9. Relationship to Standard Returns

A product inside the standard return period may still need technical review if the requested remedy depends on confirming a defect. Conversely, a customer can return an eligible unused product without opening a technical case simply because the product category also has warranty coverage.

10. Escalation Information

- Order number and product model.
- Serial number or other tracked identifier when applicable.
- Customer-reported symptom in clear language.
- Error code, software/firmware version and reproduction steps where relevant.
- Physical condition and any visible damage.
- Troubleshooting already completed and its result.
- Customer data-loss considerations if the device may be reset.

11. Customer Communication

Technical support should explain which step is confirmed and which step is still under review. “Inspection required” should not be described as “replacement approved.” If the service result changes the expected outcome, communicate the inspection finding and available remedy without implying that every similar case will have the same result.
