NEXA RETAIL

Payments, Refunds and Invoicing Guide

Payment capture, refund settlement, partial refunds, invoices and payment-related customer cases

Version 3.0 | Published: June 22, 2026

Purpose

This guide describes the financial events used after checkout and after an approved return or cancellation. It helps support and operations teams distinguish payment authorization, capture, refund instruction, settlement and customer account posting.

1. Supported Payment Flows

Available payment methods can include credit cards, debit cards, bank transfer and supported digital wallets. The exact methods shown at checkout depend on the sales channel, order value and service availability.

A successful checkout confirmation does not always mean that every payment event has settled. Card authorization, capture and later refund are separate events and should be read from the transaction record.

2. Card Payments

Card transactions can include authorization, capture, reversal and refund. A canceled order may produce an authorization release rather than a posted refund when the payment was never fully captured. The customer's bank can display these events differently.

2.1 Installments

When an installment order is refunded, the receiving bank decides how the refund is presented in the card statement. Nexa Retail sends the refund according to the original payment transaction; the bank may show individual installment effects or a separate credit entry.

3. When a Refund Starts

A refund starts only after the relevant operational decision has been completed and a refund instruction is created. Carrier delivery of a return parcel or warehouse receipt alone is not a refund instruction.

For returns, the payment team relies on the approved return amount supplied by the return process. For cancellations, the payment action depends on whether the original transaction was captured or is still in an authorization stage.

4. Refund Timing

There is no single guaranteed posting period that applies to every refund. Payment method, bank processing, weekends, installment handling and payment-provider settlement can affect the time between the refund instruction and the customer seeing the amount.

Customer communication should use the actual refund instruction date and available payment reference. If the payment channel reports completion but the customer cannot see the funds, the bank or payment provider may need to trace the reference.

Support language Do not promise a fixed “3-10 business day” settlement window as a contractual SLA for all payment methods. Use the recorded payment event and the payment method.

4.1 Refund Completed status

A system status of Refund Completed means Nexa Retail has completed the recorded refund action in the payment flow. It does not guarantee that the receiving bank has already displayed the credit in the customer account.

5. Bank Transfer Refunds

Bank-transfer orders may require verified account information for a refund. If the destination account data is missing, invalid or subject to ownership review, the payment remains pending even though the return or cancellation itself is approved.

5.1 Account owner mismatch

Where the requested destination account owner differs from the order or original payer, Finance may request supporting confirmation before releasing funds. This control is intended to reduce misdirected payments.

6. Digital Wallets

Wallet refunds are sent through the original wallet transaction where supported. The wallet provider can show its own intermediate status before the amount appears in the underlying card or wallet balance. Customer-facing teams should use the Nexa Retail refund reference together with provider guidance.

7. Partial Refunds

A partial return or order adjustment can create a refund smaller than the visible list price of the returned item when promotions, basket discounts or gift-item conditions affected the original transaction. The refund is calculated from the actual financial allocation in the order.

7.1 Multi-item campaigns

If a discount required several products to remain in the basket, returning one product can change the discount allocation. The refund result should follow the recorded campaign calculation rather than a manual list-price estimate.

8. Duplicate or Failed Payments

8.1 Customer reports a duplicate charge

Confirm whether there are two captured transactions or whether one line is a temporary authorization. Where two captures exist for one order, open a payment investigation using both transaction references.

8.2 Checkout failed but the bank shows a charge

An unsuccessful checkout can leave a temporary authorization at the bank. If Nexa Retail has no captured order transaction, the event may expire or be released by the bank instead of being processed as a normal refund.

8.3 Refund instruction failed

A failed refund should remain visible for payment operations and should not be described as completed. Common causes include unavailable payment route, invalid bank information or provider rejection. The case should retain the failure code and transaction reference.

9. Invoices

Electronic invoices are generated from the completed order record when required by the sales process. Invoice availability can lag behind order creation while fulfillment and financial records are finalized.

9.1 Incorrect invoice information

If invoice identity or address data is incorrect, determine whether the invoice can be corrected under the applicable invoicing rules. Do not manually edit a financial document outside the approved invoicing process.

10. Payment References

- Order number - identifies the purchase.
- Payment transaction reference - identifies the original payment event.
- Refund reference - identifies the refund instruction or provider result.
- Bank transfer reference - identifies the outgoing transfer where applicable.

Example PAY-9284137 and RF-622914 can refer to different stages of the same order payment lifecycle. Support should state which reference is being provided.

11. Customer Communication

- Confirm whether a refund instruction actually exists before discussing bank posting.
- Provide the refund instruction date and reference where available.
- Distinguish authorization release, cancellation and refund.
- Do not ask the customer to share full card numbers or sensitive authentication values.
- Escalate when the payment record and customer bank evidence cannot be reconciled.

12. Related Processes

- Return Process and Customer Requests - operational approval and return amount.
- Shipping and Delivery Operations Guide - return transport before warehouse acceptance.
- Account Access and Security Guide - security handling for suspicious payment/account activity.
