Internal Operations Bulletins

Selected operational notices affecting customer service, fulfillment, returns, payments and account support

Version 4.6 | Published: September 5, 2026

Purpose

This collection consolidates operational notices that were distributed to service and operations teams. Some notices describe temporary conditions, planned changes or incident workarounds. Teams should read each notice together with its date and stated operational window.

November 3, 2025 - Campaign Delivery Capacity

Campaign volume is expected to increase carrier transit time for selected standard-delivery orders. Customer-facing teams may communicate an estimated 3-7 business-day delivery period for campaign shipments dispatched between November 3 and November 17. Same-day services remain subject to postcode capacity and checkout confirmation.

December 17, 2025 - Return Handling Reminder

For standard online products, the return request should be opened within 14 calendar days from delivery. Split deliveries must be checked per item. Agents should continue to use the return action available from the customer order record and should not create duplicate return cases when an existing request is active.

January 15, 2026 - Planned Return Process Change

A return-process change is scheduled for February 1. Training material and customer-help content are being updated. Until the effective date, agents should continue handling standard returns under the existing return window and should avoid applying the planned timing early.

February 1, 2026 - Return Process Deployment

The updated return process is now active for standard eligible online products. New return requests use a 30-calendar-day window from delivery. Existing open returns continue under their recorded case state. Product-specific exclusions and campaign conditions remain applicable.

The customer web path remains under Account > Orders > Order Details. Mobile presentation can differ by app version, but the action is attached to the relevant order item.

February 5, 2026 - Customer Help Content Review

Some customer-help pages and saved agent responses still contain earlier return-window wording. Agents should avoid copying saved text without checking the active return process. Content owners are updating the affected help entries.

February 20, 2026 - Return Code Integration Incident

The contracted-carrier return-code service is intermittently rejecting newly generated codes. During the incident, support may provide the order number to the designated carrier desk only where the incident playbook explicitly allows it and the return request is active. Record that the incident workaround was used.

February 22, 2026 - Return Code Integration Restored

Carrier return-code generation is operating normally. Stop using the temporary order-number workaround for new handoffs. Customers with a return already accepted by the carrier during the incident do not need to restart the shipment.

March 10, 2026 - Mobile Return Navigation

The mobile application return action has moved under Profile > Orders > Return / Exchange for the current app release. The web route remains available from Account > Orders > Order Details. Customer-help wording will be adjusted over the next content cycle.

March 24, 2026 - Promotion Returns

For multi-item campaign orders, a partial return can change the discount allocation. Do not manually calculate the refund from list price. Use the amount created by the return/payment process and escalate if the campaign calculation does not match the order record.

April 2, 2026 - Standard Delivery Communication

Customer-facing standard delivery guidance should use 2-5 business days after dispatch for supported service areas. Older saved responses that refer to 1-3 business days should be removed when encountered. Campaign and carrier incident notices can still override the standard estimate for affected orders.

April 14, 2026 - Password Reset Delivery Delay

Password-reset emails are experiencing delays for a subset of customers. Do not repeatedly trigger reset messages at short intervals. Confirm the account email and advise the customer to wait for the latest message before requesting another reset.

April 15, 2026 - Password Reset Delivery Recovered

Reset-message delivery has returned to normal. Customers who requested several messages during the incident should use the most recent valid reset link and ignore older messages.

May 7, 2026 - Defective Product Handling

Technical review is required for selected product groups before replacement is approved. A customer report that a product is defective should be recorded with the symptom and any completed troubleshooting. Do not promise automatic replacement before the required inspection or product-specific decision is complete.

May 19, 2026 - Technical Service Timing

The generic “10 business days” service estimate is not suitable for all technical cases. Service time varies by product, fault and part availability. Use the actual case estimate when one is available and describe unconfirmed timing as an estimate rather than a commitment.

June 22, 2026 - Refund Timing Communication

Refund communication should be based on the actual refund instruction date, payment method and payment reference. The phrase “3-10 business days” must not be used as a guaranteed settlement period across all payment methods. Bank posting can occur after Nexa Retail has completed its recorded refund action.

July 9, 2026 - Account Security Durations

Support should not rely on fixed remembered values for password-reset links, one-time codes or temporary sign-in protections. Use the expiry or system message presented by the active security flow. Existing internal notes that quote a universal 24-hour reset-link period or a universal 30-minute lockout should not be reused.

August 18, 2026 - Carrier Tracking Delay

Carrier tracking updates are delayed for some return parcels. A parcel may have moved without a new public scan. Do not create duplicate return shipments solely because tracking has not updated. Use the existing tracking number and open a carrier trace only when the case is beyond the expected movement window.

August 19, 2026 - Carrier Tracking Delay Resolved

Tracking updates have normalized. Continue using the existing parcel and return records. Cases already escalated can remain open until the shipment movement is confirmed; no new workaround is required.

September 5, 2026 - Document Use Reminder

Operational documents remain available for historical case review, and older versions may contain information that is still relevant to the period in which a case occurred. For current customer handling, use the active process and the latest operational notice that applies to the case date and topic.

Temporary incident instructions apply only during the stated operational condition. A workaround recorded in an older case should not be treated as a permanent rule if a later notice closed the incident or restored the normal process.

General Bulletin Handling

- Read the bulletin date before applying an instruction.
- Distinguish planned changes from changes that are already active.
- When an incident is closed, return to the standard process unless the closure notice states otherwise.
- Keep temporary workaround usage visible in the customer case.
- Use formal process documents for detailed rules when a bulletin only announces the change.

Operational Cross-References

The bulletins above interact with the standard process documents in different ways. Return-window and refund-timing notices affect customer communication, while incident notices can temporarily change how a normal step is performed. Teams should keep the operational event date visible when reviewing older cases.

- Return Process and Customer Requests - standard return flow and eligibility.
- Shipping and Delivery Operations Guide - carrier and return-transport handling.
- Warranty and Technical Support Guide - defect inspection and service outcomes.
- Payments, Refunds and Invoicing Guide - refund and settlement events.
- Account Access and Security Guide - account recovery and verification controls.

Escalating an Unclear Bulletin

If a bulletin appears to conflict with a detailed process and the applicable time period is unclear, record the documents and dates being compared and ask the owning operations team for clarification. Do not silently combine two incompatible instructions into a new customer policy.
